Conclusion	3

Introduction

As preparation for the CMPG315 group project, I completed several online courses that focus on productivity, version control, project management, and networking tools. These courses helped me develop both technical and practical skills that will be useful when working on the Packet Tracer network design project. The courses included time management strategies, Git and GitHub fundamentals, project management basics, and an introduction to Cisco Packet Tracer. This report reflects on what I learned from these courses and how the knowledge gained will assist me during the project.

Time Management and Productivity

The time management course taught several practical ways to become more productive and manage time more effectively. One concept that stood out to me was the idea of focusing on the most important tasks first instead of trying to do everything at once. The course explained how many people fall into a “time management trap,” where they spend too much time planning instead of actually completing tasks.

I also learned about the importance of setting clear goals every day. Planning tasks each morning and identifying priorities can make a big difference in how productive the day becomes. Another useful concept introduced was the 80/20 rule, which suggests that a small number of important tasks often produce most of the results.

These lessons are useful for the CMPG315 project because the project includes several phases and strict deadlines. By applying these time management techniques, I will be able to organize my work better and make sure I contribute effectively to the group.

Git and GitHub

The Git and GitHub course introduced me to the concept of version control and how it is used in software development. Before this course, I had limited knowledge about Git and how developers collaborate on projects using platforms like GitHub.

During the course, I learned how to create repositories, clone projects from GitHub, and track changes using commits. I also learned how to push changes from my local computer to GitHub so that other team members can see and access the updated files.

One of the most useful things I learned is that Git keeps a history of all changes made to a project. This means if something goes wrong or a mistake is made, the project can easily be restored to a previous version. This is very helpful when multiple people are working on the same project.

These skills will be helpful for the CMPG315 group project because GitHub can be used to share files, manage documentation, and keep track of the work done by each group member.

Project Management

The project management course introduced the basic concepts of planning, executing, and monitoring projects. One important lesson from this course is that successful projects require proper planning and clear communication between team members.

I learned about setting project goals, creating timelines, assigning responsibilities, and tracking project progress. The course also explained the importance of monitoring project tasks to ensure everything is completed on schedule.

These skills will help my group manage the CMPG315 project more effectively. By using proper planning and communication, we can ensure that all members understand their roles and responsibilities and that tasks are completed before the deadlines.

Cisco Packet Tracer

The Cisco Packet Tracer training introduced the basics of network simulation and how networks can be designed in a virtual environment. Packet Tracer is a powerful tool that allows users to create network topologies, configure devices, and simulate how data travels through a network.

Through this training, I learned how to create network layouts, configure routers and switches, assign IP addresses, and test connectivity between devices. I also learned how simulation mode can be used to observe how packets move across the network.

These skills are directly related to the CMPG315 project because our group will be required to design and simulate a network for a company building. Using Packet Tracer will allow us to test whether the network works correctly before presenting it.

Conclusion

Overall, the courses I completed provided valuable knowledge and skills that will help me contribute to the CMPG315 project. The time management course improved my productivity and planning skills, while the Git and GitHub course introduced useful tools for collaboration and version control. The project management course helped me understand how projects should be organized and monitored, and the Cisco Packet Tracer training provided important networking skills required for the project.

These courses helped prepare me for the technical and collaborative aspects of the project, and I believe the skills I gained will be useful both in this module and in my future career.
